Reduce Losses from Voles

- Voles cause extensive damage to hops when gnawing on roots and on the bark of seedlings and vines (called girdling).
- Vole girdling disrupts the flow of nutrients and water, reducing plant vigor.
- Vole feeding kills vines, fruiting walls and smaller plantings, causes foliage and production loss, and root disease by exposing vulnerable tissue and creating air pockets.
- Root damage from vole feeding exhibit stunting and foliage reduction, resulting in production losses.

- Voles kill or weaken plants and the damage is felt over the plant's productive life; treatment costs become inconsequential.¹
- It typically takes two rodenticide applications per season to bring the vole population under control.¹
- In 2016, we estimate that approximately 350 acres of WA Hops were *completely destroyed* by vole damage. Using a gross return of \$10,000 per acre this adds up to an estimated \$3.5 million loss. This equates to over 1% of acreage (>37,000A), and over 1% of the farmgate crop value of WA Hops (\$280M) in 2016.²

Pine vole.

Vole runway damage to turf.

Vole root feeding.

Bait stations are an effective baiting tool on border areas / buffer strips
